PLANT FEEDING
DURING GROWTH
CHARACTERISTICS
THE DIFFERENT

VIVA BALANCED COMPOUNDS

- Viva Balanced: Fertilizer compounds manufactured with great care to meet all the needs of plants in terms of potash, phosphorous, nitrogen, and trace elements: -
- Viva Balanced is used for all types of plants and agricultural crops in case there is a need for high percentages of the essential elements (NPK) necessary for plants.
- Fast acting, improves plant growth, and stimulates the action of enzymes in the plant.
- It positively enhances the absorption of nutrients through leaves and roots.
- It works to raise the efficiency of photosynthesis and respiration of plants, increase productivity, and improve crop quality.
- It provides the various elements in a balanced way and meets the need of plants from the basic elements (NPK).

Features of use:

- Its balanced formula allows it to be used in all stages of plants life, from germination to the stage of fruiting and harvesting.
- Supports flowering and fruit set, improves its quality and prolongs its shelf life.
- It helps correct the symptoms of nutrient deficiency when the cause of the deficiency cannot be determined.
- It contains magnesium, which contributes to the building of chlorophyll and the process of photosynthesis and has an important role in the synthesis of important plant enzymes for growth, which contributes to proper growth of plants and thus to increase the crops.
- It is used for crops that need equal proportions of the NPK at the same time. For example, crops with gradual maturities that grows and bears flowers and produce fruits at the same time.
- Increase plant tolerance and resistance to unsuitable conditions (frost, drought...)
- Increase the quantity and quality of production.
- (It is used in all irrigation and foliar sprinkler systems.)

Packing: 1-10-20-25 kg
